6. HTTP RESPONSE STATUS CODES

HTTP response status codes indicate whether a specific HTTP request has been successfully completed.

Status Code	Description	
200	The request succeeded. The result meaning of "success" depends on the HTTP method: - GET: The resource has been fetched and transmitted in the message body. POST / PATCH: The resource describing the result of the action is transmitted in the message body.	
201	The request succeeded, and a new resource was created as a result.	
400	The server cannot or will not process the request due to something that is perceived to be a client error (e.g., malformed request syntax, invalid request message framing, or deceptive request routing).	
401	Although the HTTP standard specifies "unauthorized", semantically this response means "unauthenticated". That is, the client must authenticate itself to get the requested response.	
403	The client does not have access rights to the content; that is, it is unauthorized, so the server is refusing to give the requested resource. Unlike 401 Unauthorized, the client's identity is known to the server.	
404	The server cannot find the requested resource. In the browser, this means the URL is not recognized. In an API, this can also mean that the endpoint is valid but the resource itself does not exist. Servers may also send this response instead of 403 Forbidden to hide the existence of a resource from an unauthorized client. This response code is probably the most well known due to its frequent occurrence on the web.	
422	The request was well-formed but was unable to be followed due to semantic errors.	
500	The server has encountered a situation it does not know how to handle.	

7. GENERAL ERRORS

Unexpected errors are handled with a standard error message. These error messages also contain a process id number, which is used during troubleshooting or follow-up.

Error Code	Error Message
999	Process failure occurred. Process ID associated for that transaction (<sessionid>)</sessionid>

8. RATING AND PRODUCT API ERRORS
